                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 2582, Application US/09938842A

Sequence 2582, Application US/09938842A

Patent No. US20020160378A1

GARBRAL INFORMATION:

APPLICANT: Harper, Joef

APPLICANT: APPLICANT: ALM, Tong

TITLE OF INVENTION: STRESS-REGULATED GENES OF PLANTS, TRANSGENIC PLANTS CONTAINING

TITLE OF INVENTION: STRESS-REGULATED GENES OF PLANTS, TRANSGENIC PLANTS CONTAINING

TITLE OF INVENTION: STRESS-REGULATED GENES OF PLANTS, TRANSGENIC PLANTS CONTAINING

FILE REFERENCE: SCRIP1300-3

CURRENT APPLICATION NUMBER: US 60/227, 866

PRIOR APPLICATION NUMBER: US 60/227, 866

PRIOR PLING DATE: 2001-08-24

PRIOR PLING DATE: 2001-01-16

PRIOR PLING DATE: 2001-01-16

PRIOR PLING DATE: 2001-06-25

NUMBER OF SEQ ID NOS: 5379

SEQ ID NO 2582

LENGTH: 1149

                             BookI adapters (5'0H-AATTCGGCACGAG and 3'GCCGTGCTCP) were ligated to the blunt-ended cDNA fragments followed by XhoI digestion. The CDNA fragments were directionally cloned into the EcoRI-XhoI restriction sites of the pBluescript vector. The vector was previously dephosphorylated. The ligated cDNA fragments were transformed into DH10B by electroporation. Library is in LB medium with ampicillin and glycerol 3. Average insert size: 800 bp."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     B0452916.1 G1:21256028

/note="Torgan: Root: Vector: pGEM; Forrest roots were inoculated with Fusarium solani f. sp. glycinae and samples were collected after 14 days of inoculation. Total RNA was used for CDNA synthesis using SMART PCR CDNA Synthesis kit (CLONTECH, CA). CLONTECH PCR.Select Subtraction system was used to enrich rare transcripts expressed in Forrest roots under inoculation by F. solani and cloned in pGEM vector. ESTS were sequenced using M13 universal forward or reverse primer."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ò
Nhol; At the trifoliate Stage, M. truncatula plants were transplanted to phosphate-free sand and grown for a further 30 days. During this period, they were fertilized twice weekly with 1/2 Hoadlands solutions containing 20um potassium phosphate. cDNA was prepared from polyA+ enriched RNA. The CDNA was directionally ligated into the Unizap XR vector from Strateagene and packaged using Gigapack III Gold packaging extracts. Plasmids containing phase using Ex-assist helper phage and propagated in
                                                                                                                                                                                                                                                                                                                                                                                                    2;

//note="Vector: pBluescript II SK+; Site 1: ECORI; Site 2: XhoI; The CDNA library was constructed from mRNA isolated from mRNA isolated from mRNA isolated from mRNA isolated from mRNA isolated from mRNA isolated from mRNA isolated from mRNA isolated from mRNA isolated from mRNA isolated from mRNA isolated from mRNA isolated from mRNA isolated from mRNA plant tissue (axpanded average with Pseudomonas syringae pv. 4) 4, 8, 12, 24, 36, and 53 hrs after inoculation and their mRNA pooled equally for cDNA construction. The library was prepared using the Stratagene pBluescript II SK(+) library construction kit. Complementary DNA was synthesized from mRNA using a primer consisting of a poly(dT) sequence with an XhoI restriction site. EcoRI adaptors were ligated to the blunt ended cDNA fragments followed by XhoI digestion. The cDNA insert is protected from XhoI digestion via methylation during first strand synthesis. The CDNA fragments were directionally cloned into the ECORI-XhoI restriction site of the

consisting of a poly(dT) sequence with an XhoI restriction site. EcoRI adaptors were ligated to the blunt-ended cDNA fragments followed by XhoI digestion. The cDNA insert is protected from KhoI digestion via methylation during first strand synthesis. The cDNA fragments were directionally closed into the EcoRI-XhoI restriction site of the pBluescript vector. The ligated cDNA fragments were transformed into E.coli ElectroMax DHIOB host cells. Plant performed by Steve Clough (Lila Vodkin lab, University of Illinois)."

//note="Wector: pBluescript II SK+; Site I: EcoRI; Site 2:
Xhoi; The CDNA library was constructed from mRNA isolated
from 2-3 week old seedlings that were induced for symptoms
of SDS (Sudden Death Syndrome) disease by the
translocation of culture filtrate of Fusarium solani f.
Sp. glycines (Plant Cell Report 18:375-380). Cultivar PI
567374 is partially resistant to the disease SDS. Plant
tissue (expanded leaves, folded leaves, and new shoots)
were collected at 1, 6, 24, and 48 hrs. after incculation
and their mRNA pooled equally for cDNA construction. The
library was prepared using the Stratagene pBluescript II
SK(+) library construction kit. Complementary DNA was
synthesized from mRNA using a primer consisting of a
poly(dT) sequence with an XhoI restriction site. BookI
adaptors were ligated to the blunt ended cDNA fragments
followed by XhoI digestion. The cDNA insert is protected
from XhoI digestion via methylation during first strand
synthesis. The cDNA fragments were directionally cloned
into the EcoRI-XhoI restriction site of the pBluescript
vector. The ligated cDNA fragments were inculated
by Shnxian Li (Glen Hartman lab, University of Illinois).
Library was constructed by Steve Clough (Lila Vodkin lab,
University of Illinois)."

/note="Vector: Bluescript SK-; Site_l: EcoRI; Site_2:
Xhol; cDNA was prepared from polyA+ enriched RNA. The cDNA was directionally ligated into the Unizap XR vector from Stratagene and packaged using Gigapack III Gold packaging extracts. Plasmids containing cDNA inserts were excised from the recombinant lambda-Zap phage using Ex-assist helper phage and propagated in XLOLR cells."

Xhol; This cDNA library was constructed from mRNA isolated
from immature flowers of field grown plants. The cDNA
library was prepared using the Stratagene pBluescript II
XR library construction kit. Complementary DNA was
synthesized from mRNA using a primer consisting of a poly
(dT) sequence with a Xhol restriction site. EcoRI adapters
were ligated to the blunt-ended cDNA fragments followed by
Xhol digestion. The cDNA fragments were directionally
cloned into the EcoRI-Xhol restriction site of the
pBluescript vector. The ligated cDNA fragments were
transformed into XL10-Gold host cells. This library was
constructed by Dr. Randy Shoemaker and Dr. John
